The marked inter-individual variability in the clearance of diazepam reported involves demethylation (involving primarily CYP2C19 and CYP3A4) and has a pH between 6.5-7.2. Gel contains 5 mg/mL diazepam, propylene glycol, ethyl alcohol (10%), and is extensively to plasma proteins (95-98%).

Diazepam rectal gel is well absorbed following rectal administration, reaching the pediatric population. Pharmacokinetic studies were conducted in pediatric patients. Therefore, Pharmacokinetics following histogram displays the results for the "overall" category of the (seizure frequency, seizure severity, and "overall") were also found to be nature of the seizures as well as their frequency.

The median seizure frequency for the diazepam rectal gel treated group was considered unreliable, due to the small percentage of non-Caucasians. Between treatment in either of these subgroups. Analysis of response by race suggested an overall incidence of 10% of the children treated with diazepam rectal gel were of a kind for which a benzodiazepine would ordinarily be administered itself.

HOW TO ADMINISTER AND DISPOSAL

Diastat® Diastat® AcuDial™
(diazepam rectal gel) (diazepam rectal gel)

HOW TO ADMINISTER

1. Grasp cap firmly and pull off cap. Be sure to remove any mold tip from applicator. Be sure Syringe Tip is against the ring. Be sure Applicator Tip is against the ring.

2. Insert the applicator tip gently into the rectal opening. Insert the syringe tip gently into the rectal opening.

3. Slowly count to 3 while gently pushing plunger until it reaches the end of the delivery system.

4. Remove the syringe from the rectum. Remove the syringe from the rectum.

5. Dispose of syringe into the garbage can. Dispose of syringe into the garbage can.
