**Dihydroergotamine Mesylate Nasal Spray**

The solution used in Dihydroergotamine Mesylate Nasal Spray (4 mg/mL) is intended for intranasal use and must not be injected. Rx only

**WARNING**

Serious and/or life-threatening peripheral ischemia has been associated with the coadministration of Dihydroergotamine with potent CYP 3A4 inhibitors including protease inhibitors and macrolide antibiotics. Because CYP 3A4 inhibition elevates the serum levels of Dihydroergotamine, the risk for vasospasm leading to cerebral ischemia or ischemia of the extremities is increased. Hence, concomitant use of these medications is contraindicated. (See also CONTRAINDICATIONS AND WARNINGS section)

**DESCRIPTION**

Dihydroergotamine mesylate is ergotamine hydrogenated in the 9,10 position as the mesylate salt. Dihydroergotamine mesylate is known chemically as ergotaman-3',6',8'-trione, 9,10-dihydro-12'-hydroxy-2'-methyl-5'-phenylmethylenemethyl-(5'c')-noradrenaline-sulfonate. Its molecular weight is 679.78 and its empirical formula is \( 	ext{C}_{31} 	ext{H}_{34} 	ext{O}_{12} 	ext{N} 	ext{S} \). The chemical structure is:

```
\( \text{CH}_3\text{O} \)
```

**Mechanism of Action**

Dihydroergotamine binds with high affinity to 5-HT \(_{	ext{T}_{1A}}\) and 5-HT \(_{	ext{T}_{1B}}\) receptors. It also binds with high affinity to serotonin 5-HT \(_5\), 5-HT \(_{5A}\), and 5-HT \(_{5B}\) receptors, noradrenaline \( \alpha_{1A} \), \( \alpha_{1B} \), and \( \alpha_2 \) receptors, and dopamine \( D_1 \) and \( D_3 \) receptors. The therapeutic activity of dihydroergotamine in migraine is generally attributed to the agonist effect at 5-HT \(_{1A} \) receptors. Two current theories have been proposed to explain the efficacy of 5-HT \(_{1A} \) receptor agonists in migraine. One theory suggests that activation of 5-HT \(_{1A} \) receptors located on intracranial blood vessels, including those on arterio-venous anastomoses, leads to vasoconstriction, which correlates with the relief of migraine headache. The alternative hypothesis suggests that activation of 5-HT \(_{1A} \) receptors on sensory nerve endings of the trigeminal system results in the inhibition of pro-inflammatory neuropeptide release. In addition, dihydroergotamine possesses oxytocic properties. (See CONTRAINDICATIONS)

**Pharmacokinetics**

**Absorption**

Dihydroergotamine mesylate is poorly bioavailable following oral administration. Following intranasal administration, however, the mean bioavailability of dihydroergotamine mesylate is 32% relative to the injectable administration. Absorption is variable, probably reflecting both intersubject differences of absorption and the technique used for self-administration.

**Distribution**

Dihydroergotamine mesylate is 93% plasma protein bound. The apparent steady-state volume of distribution is approximately 800 liters.

**Metabolism**

Four dihydroergotamine mesylate metabolites have been identified in human plasma following oral administration. The major metabolite, \( \text{8'-} \text{dihydroxydihydroergotamine} \), exhibits affinity equivalent to its parent for adrenergic and 5-HT receptors and demonstrates equivalent potency in several vasoconstrictor activity models, in vivo and in vitro. The other metabolites, i.e., dihydrolysergic acid, dihydrolysergic amide and a metabolite formed by oxidative opening of the proximal ring are of minor importance. Following nasal administration, total metabolites represent only 20%-30% of plasma AUC. The systemic clearance of dihydroergotamine mesylate following I.V. and I.M. administration is 1.5 L/min. Quantitative pharmacokinetic characterization of the four metabolites has not been performed.

**Excretion**

The major excretory route of dihydroergotamine is via the bile in the feces. After intranasal administration the urinary recovery of parent drug amounts to about 2% of the administered dose compared to 6% after I.M. administration. The total body clearance is 1.5 L/min which reflects mainly hepatic clearance. The renal clearance (0.1 L/min) is unaffected by the route of dihydroergotamine administration. The decline of plasma dihydroergotamine is biphasic with a terminal half-life of about 10 hours.

**CLINICAL PHARMACOLOGY**

**CLINICAL PHARMACOLOGY**

**α**

explain the efficacy of 5-HT\(_{1D}\) receptor agonists in migraine. One theory suggests that activation of 5-HT\(_{1D}\) receptors located on intracranial blood vessels, including those on arterio-venous anastomoses, leads to vasoconstriction, which correlates with the relief of migraine headaches. The alternative hypothesis suggests that activation of 5-HT\(_{1D}\) receptors on sensory nerve endings of the trigeminal system results in the inhibition of pro-inflammatory neuropeptide release. In addition, dihydroergotamine possesses oxytocic properties. (See CONTRAINDICATIONS)

**Clinical Trials**

The efficacy of Dihydroergotamine Mesylate Nasal Spray for the acute treatment of migraine headaches was evaluated in four randomized, double blind, placebo controlled studies in the U.S. The patient population for the trials was predominantly female (87%) and Caucasian (95%) with a mean age of 39 years (range 18 to 65 years). Patients treated a single moderate to severe migraine headache with a single dose of study medication and assessed pain severity over the 24 hours following treatment. Headache response was determined using a five-point scale that included both pain and restoration of function. In studies 1 and 2, a four-point pain intensity scale was used; in studies 3 and 4, a five-point scale was used that included both pain and restoration of function for “severe” or “incapacitating” pain, a less clear endpoint. Although rescue medication was allowed in all four studies, patients were instructed not to use them during the four hour observation period. In studies 3 and 4, a total dose of 2 mg was compared to placebo. In studies 1 and 2, doses of 2 and 3 mg were evaluated, and showed no advantage of the higher dose for a single treatment. In all studies, patients received a regimen consisting of 0.5 mg in each nostril, repeated in 15 minutes (and again in another 15 minutes for the 3 mg dose in studies 1 and 2). The percentage of patients achieving headache response 4 hours after treatment was significantly greater in patients receiving 2 mg doses of Dihydroergotamine Mesylate Nasal Spray compared to those receiving placebo in 3 of the 4 studies (see Tables 1 & 2 and Figures 1 & 2).

*Headache response was defined as a reduction in headache severity to mild or no pain. Headache response was based on pain intensity as interpreted by the patient using a four-point pain intensity scale.

**Comparison of Drug Performance**

Comparisons of drug performance based upon results obtained in different clinical trials are not reliable. Because studies are conducted at different times, with different samples of patients, by different investigators, employing different criteria and/or different interpretations of the same criteria, under different conditions (dose, dosing regimen, etc.), quantitative estimates of treatment response and the timing of response may be expected to vary considerably from study to study.
The Kaplan-Meier plots below (Figures 1 & 2) provides an estimate of the probability that a patient will have responded to a single 2 mg dose of Dihydroergotamine Mesylate Nasal Spray as a function of the time elapsed since initiation of treatment.

Figure 1
Estimated Probability of a Patient Responding During the Four Hours Following a Single 2 mg Dose of Dihydroergotamine Mesylate Nasal Spray as a function of the time elapsed since initiation of treatment (Dihydroergotamine Mesylate N = 208, Placebo N = 200)

Figure 2
Estimated Probability of a Patient Responding to Dihydroergotamine Mesylate Nasal Spray During the Four Hours Following Dosing (Dihydroergotamine Mesylate N = 97, Placebo N = 100)

*The figure shows the probability over time of obtaining a response following treatment with Dihydroergotamine Mesylate Nasal Spray. Headache response was based on pain intensity as interpreted by the patient using a four-point pain intensity scale. Patients not achieving response within 4 hours were censored to 4 hours.

For patients with migraine-associated nausea, photophobia, and phonophobia at baseline, there was a lower incidence of these symptoms at 2 and 4 hours following administration of Dihydroergotamine Mesylate Nasal Spray compared to placebo.

There have been a few reports of serious adverse events associated with the coadministration of dihydroergotamine and potent CYP 3A4 inhibitors, such as protease inhibitors and macrolide antibiotics, resulting in vasospasm that led to cerebral ischemia and/or ischemia of the extremities. The use of potent CYP 3A4 inhibitors (ritonavir, neflavinav, indinavir, erythromycin, clarithromycin, troleandomycin, ketoconazole, itraconazole) with dihydroergotamine is, therefore contraindicated (See WARNINGS: CYP 3A4 Inhibitors).

Dihydroergotamine Mesylate Nasal Spray should not be given to patients with ischemic heart disease (angina pectoris, history of myocardial infarction, or documented silent ischemia) or to patients who have clinical symptoms or findings consistent with coronary artery vasospasm including Prinzmetal’s variant angina. (See WARNINGS)

Because Dihydroergotamine Mesylate Nasal Spray may increase blood pressure, it should not be given to patients with uncontrolled hypertension.

Dihydroergotamine Mesylate Nasal Spray should not be administered to patients with hemiplegic or basilar migraine.

CONTRAINDICATIONS

There are no adequate studies of dihydroergotamine in human pregnancy, but developmental toxicity has been demonstrated in experimental animals.

In embryofetal development studies of Dihydroergotamine Mesylate Nasal Spray, intranasal administration to pregnant rats throughout the period of organogenesis resulted in decreased fetal body weights and/or skeletal ossification at doses of 0.16 mg/day (associated with maternal plasma dihydroergotamine exposures [AUC] approximately 0.4 -1.2 times the exposures in humans receiving the MRDD of 4 mg) or greater. A no effect level for embryo-fetal toxicity was not established in rats. Delayed skeletal ossification was also noted in rabbit fetuses following intranasal administration of 3.6 mg/day (maternal exposures approximately 7 times human exposures at the MRDD) during organogenesis.

A no effect level was seen at 1.2 mg/day (maternal exposures approximately 2.5 times human exposures at the MRDD). When Dihydroergotamine Mesylate Nasal Spray was administered intranasally...
to female rats during pregnancy and lactation, decreased body weights and impaired reproductive function (decreased mating indices) were observed in the offspring at doses of 0.16 mg/day or greater. A re no effect level was not established. Effects on development occurred at doses below those that produced evidence of significant maternal toxicity in these studies. Dihydroergotamine-induced intrauterine growth retardation has been attributed to reduced uteroplacental blood flow resulting from prolonged vasoconstriction of the uterine vessels and/or increased myometrial tone. Dihydroergotamine Mesylate Nasal Spray is contraindicated in patients who have previously shown hypersensitivity to ergot alkaloids.

Dihydroergotamine mesylate should not be used by women of child-bearing age. (See PRECAUTIONS)

Dihydroergotamine mesylate should not be used with peripheral and central vasoconstrictors because the combination may result in additive or synergistic elevation of blood pressure.

WARNINGS
Dihydroergotamine Mesylate Nasal Spray should only be used where a clear diagnosis of migraine headache has been established.

CYP 3A4 Inhibitors (e.g. Macroline Antibiotics and Protease Inhibitors)

There have been rare reports of serious adverse events in connection with the concomitant use of dihydroergotamine and potent CYP 3A4 inhibitors, such as protease inhibitors and macroline antibiotics, resulting in vasospasm that led to cerebral ischemia and/or ischemia of the extremities. The use of potent CYP 3A4 inhibitors with dihydroergotamine should therefore be avoided (See CONTRAINDICATIONS).

Dihydroergotamine mesylate should not be used with these agents unless, in the opinion of the physician, the potential for adverse cardiac events exists. The potential for adverse cardiac events exists. Serious adverse cardiac events that have been reported include: angina pectoris, myocardial infarction, sudden cardiac death, dysrhythmias, cardiomyopathy and heart failure. These lists are not exhaustive, and the prescriber should consider the effects on CYP 3A4 of other agents being considered for concomitant use with dihydroergotamine.

Fibrotic Complications

There have been reports of pleural and retropertitoneal fibrosis in patients following prolonged daily use of injectable dihydroergotamine mesylate. Rarely, prolonged daily use of other ergot alkaloid drugs has been associated with cardiac valvular fibrosis. Other cases have also been reported in association with the use of injectable dihydroergotamine mesylate; however, in those cases, patients also received drugs known to be associated with cardiac valvular fibrosis.

Administration of Dihydroergotamine Mesylate Nasal Spray, should not exceed the dosing guidelines and should not be used for chronic daily administration (see DOSAGE AND ADMINISTRATION).

Risk of Myocardial Ischemia and/or Infarction and Other Adverse Cardiac Events: Dihydroergotamine Mesylate Nasal Spray should not be used by patients with documented ischemic or vasospastic coronary artery disease. (See CONTRAINDICATIONS).

It is strongly recommended that Dihydroergotamine Mesylate Nasal Spray should not be used in patients in whom unrecognized coronary artery disease (CAD) is suspected by the presence of risk factors. CYP 3A4 inhibitors include: antifungals ketoconazole and itraconazole, the protease inhibitors ritonavir, neflavin, and indinavir, and macroleone antibiotics erythromycin, clarithromycin, and troleandomycin. Other less potent CYP 3A4 inhibitors should be administered with caution. Less potent inhibitors include saquinavir, nefazodone, fluconazole, grapefruit juice, fluoxetine, and other long-acting triptans. These lists are not exhaustive, and the prescriber should consider the effects on CYP 3A4 of other agents being considered for concomitant use with dihydroergotamine.

Drug-Associated Cerebrovascular Events and Fatalities

Cerebral hemorrhage, subarachnoid hemorrhage, stroke, and other cerebrovascular events have been reported in patients treated with D.H.E. 45® injection; and some have resulted in fatalities. In a number of cases, it appears possible that the cerebrovascular events were primary, i.e., the D.H.E. 45® injection having been administered in the incorrect belief that the symptoms experienced were a consequence of migraine, when they were not. It should be noted that patients with migraine may be at increased risk of certain cerebrovascular events (e.g., stroke, hemorrhage, transient ischemic attack).

Other Vasospasm Related Events

Dihydroergotamine Mesylate Nasal Spray, like other ergot alkaloids, may cause vasospastic reactions other than coronary artery vasospasm. Myocardial and peripheral vascular ischemia have been reported with Dihydroergotamine Mesylate Nasal Spray. Dihydroergotamine Mesylate Nasal Spray associated vasospastic phenomena may also cause muscle pain, numbness, coldness, pallor, and cyanosis of the digits. In patients with compromised circulation, persistent vasospasm may result in gangrene or death. Dihydroergotamine Mesylate Nasal Spray should be discontinued immediately if signs or symptoms of vasconstriction develop.

Increase in Blood Pressure

Significant elevation in blood pressure has been reported on rare occasions in patients with and without a history of hypertension treated with Dihydroergotamine Mesylate Nasal Spray and dihydroergotamine mesylate injection. Dihydroergotamine Mesylate Nasal Spray is contraindicated in patients with uncontrolled hypertension. (See CONTRAINDICATIONS.)

An 18% increase in mean pulmonary artery pressure was seen following dosing with another 5HT1 agonist in a study evaluating subjects undergoing cardiac catheterization.

Local Irritation

Approximately 30% of patients using Dihydroergotamine Mesylate Nasal Spray (compared to 9% of placebo patients) have reported irritation in the nose, throat, and/or throat discomforts in taste. Irritative symptoms include congestion, burning sensation, dryness, paraesthesia, discharge, epistaxis, pain, or soreness. The symptoms were predominantly mild to moderate in severity and transient. In approximately 70% of the above mentioned cases, the symptoms resolved within four hours after dosing with Dihydroergotamine Mesylate Nasal Spray. Examinations of the nose and throat in a small subset (N = 66) of study participants treated for up to 90 days revealed no nasal or pharyngeal injury to the mucous membranes.

Fibrotic Complications: see WARNINGS: Fibrotic Complications.

Risk of Myocardial Ischemia and/or Infarction and Other Adverse Cardiac Events: Dihydroergotamine Mesylate Nasal Spray should not be used by patients with documented ischemic or vasospastic coronary artery disease. (See CONTRAINDICATIONS).

It is strongly recommended that Dihydroergotamine Mesylate Nasal Spray should not be used in patients in whom unrecognized coronary artery disease (CAD) is suspected by the presence of risk factors. CYP 3A4 inhibitors include: antifungals ketoconazole and itraconazole, the protease inhibitors ritonavir, neflavin, and indinavir, and macroleone antibiotics erythromycin, clarithromycin, and troleandomycin. Other less potent CYP 3A4 inhibitors should be administered with caution. Less potent inhibitors include saquinavir, nefazodone, fluconazole, grapefruit juice, fluoxetine, and other long-acting triptans. These lists are not exhaustive, and the prescriber should consider the effects on CYP 3A4 of other agents being considered for concomitant use with dihydroergotamine.

Precautions

General

Dihydroergotamine Mesylate Nasal Spray may cause coronary artery vasospasm; patients who experience signs or symptoms suggestive of angina following its administration should, therefore, be evaluated for the presence of CAD or trauma. The drug should be administered with caution to patients with a history of coronary artery disease or myocardial ischemia. Dihydroergotamine Mesylate Nasal Spray should not be used in patients with uncontrolled hypertension. (See WARNINGS).

Fibrotic Complications: see WARNINGS: Fibrotic Complications.

Information for Patients

The text of a patient information sheet is printed at the end of this insert. To assure safe and effective use of Dihydroergotamine Mesylate Nasal Spray, the information and instructions provided in the patient information sheet should be discussed with patients. Once the nasal spray applicator has been prepared, it should be discarded (with any remaining drug) after 8 hours.

Patients should be advised to report to the physician immediately any of the following: numbness or tingling in the fingers and toes, muscle pain in the arms and legs, weakness in the legs, pain in the chest, temporary speeding or slowing of the heart rate, swelling, or itching.

Prior to the initial use of the product by a patient, the prescriber should make arrangements for the patient to understand how to use the product as provided. (See Information Sheet and Product packaging).

Dose Administration of Dihydroergotamine Mesylate Nasal Spray, should not exceed the dosing guidelines and should not be used for chronic daily administration (see DOSAGE AND ADMINISTRATION).

Drug Interactions

Vasoconstrictors

Dihydroergotamine Mesylate Nasal Spray should not be used with peripheral vasoconstrictors because the combination may cause synergistic elevation of blood pressure.

Sumatriptan

Sumatriptan has been reported to cause coronary artery vasospasm, and its effect could be additive with dihydroergotamine mesylate nasal spray. Sumatriptan and Dihydroergotamine Mesylate Nasal Spray should not be taken within 24 hours of each other. (See CONTRAINDICATIONS).
Beta Blockers
Although the results of a clinical study did not indicate a safety problem associated with the administration of Dihydroergotamine Mesylate Nasal Spray to subjects already receiving propranolol, there have been reports that propranolol may potentiate the vasoconstrictive action of ergotamine by blocking the vasodilating property of epinephrine.

Nicotine
Nicotine may provoke vasconstriction in some patients, predisposing to a greater ischemic response to ergot therapy.

CYP 3A4 Inhibitors (e.g., Macrolide Antibiotics and Protease Inhibitors)
See CONTRAINDICATIONS and WARNINGS.

SSRI's
Weakness, hyperreflexia, and incoordination have been reported rarely when 5HT1 agonists have been coadministered with SSRIs (e.g., fluoxetine, fluvoxamine, paroxetine, sertraline). There have been no reported cases of spontaneous reports of drug interaction between SSRIs and Dihydroergotamine Mesylate Nasal Spray or D.H.E. 45®.

Oral Contraceptives
The effect of oral contraceptives on the pharmacokinetics of Dihydroergotamine Mesylate Nasal Spray has not been studied.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis
Assessment of the carcinogenic potential of dihydroergotamine mesylate in mice and rats is ongoing.

Mutagenesis
Dihydroergotamine mesylate was clastogenic in two in vitro chromosomal aberration assays, the V79 Chinese hamster cell assay with metabolic activation and the cultured human peripheral blood lymphocyte assay. There was no evidence of mutagenic potential when dihydroergotamine mesylate was tested in the presence or absence of metabolic activation in two gene mutation assays (the Ames test and the in vitro mammalian Chinese hamster V79/HGPRT assay) and in an assay for DNA damage (the rat hepatocyte unscheduled DNA synthesis test). Dihydroergotamine was not clastogenic in the in vivo mouse and hamster micronucleus tests.

Impairment of Fertility
There was no evidence of impairment of fertility in rats given intranasal doses of Dihydroergotamine Mesylate Nasal Spray up to 1.6 mg/day (associated with mean plasma dihydroergotamine mesylate exposures [AUC] approximately 9 to 11 times those in humans receiving the MRDD of 4 mg).

Pregnancy
See CONTRAINDICATIONS.

Nursing Mothers
Ergot drugs are known to inhibit prolactin. It is likely that Dihydroergotamine Mesylate Nasal Spray is excreted in human milk, but there are no data on the concentration of dihydroergotamine in human milk. It is known that ergotamine is excreted in breast milk and may cause vomiting, diarrhea, weak pulse, and unstable blood pressure in nursing infants. Because of the potential for these serious adverse events in nursing infants exposed to Dihydroergotamine Mesylate Nasal Spray, nursing should not be undertaken with the use of Dihydroergotamine Mesylate Nasal Spray. (See CONTRAINDICATIONS).

Pedicatric Use
Safety and effectiveness in pediatric patients have not been established.

Use in the Elderly
There is no information about the safety and effectiveness of Dihydroergotamine Mesylate Nasal Spray in this population because patients over age 65 were excluded from the controlled clinical trials.

ADVERSE REACTIONS
During clinical studies and the foreign postmarketing experience with Dihydroergotamine Mesylate Nasal Spray there have been no fatalities due to cardiac events.

Serious cardiac events, including some that have been fatal, have occurred following use of the parenteral form of dihydroergotamine mesylate (D.H.E. 45® Injection), but are extremely rare. Events reported have included coronary artery vasospasm, transient myocardial ischemia, myocardial infarction, ventricular tachycardia, and ventricular fibrillation. (See CONTRAINDICATIONS, WARNINGS, and PRECAUTIONS).

Fibrotic complications have been reported in association with long term use of injectable dihydroergotamine mesylate (see WARNINGS: Fibrotic Complications).

Incidence in Controlled Clinical Trials
Of the 1,796 patients and subjects treated with Dihydroergotamine Mesylate Nasal Spray doses 2 mg or less in U.S. and foreign clinical studies, 26 (1.4%) discontinued because of adverse events. The adverse events associated with discontinuation were, in decreasing order of frequency: rhinitis 13, dizziness 2, facial edema 2, and one each due to cold satchets, accidental trauma, depression, elective surgery, somnolence, allergy, vomiting, hypotension, and paraesthesia.

The most commonly reported adverse events associated with the use of Dihydroergotamine Mesylate Nasal Spray during placebo-controlled, double-blind studies for the treatment of migraine headache and not reported at an equal incidence by placebo-treated patients were rhinitis, altered sense of taste, application site reactions, dizziness, nausea, and vomiting. The events cited reflect experience gained under closely monitored conditions of clinical trials in a highly selected patient population. In actual clinical practice or in other clinical trials, these frequency estimates may not apply, as the conditions of use, reporting behavior, and the kinds of patients treated may differ.

Dihydroergotamine Mesylate Nasal Spray was generally well tolerated. In most instances these events were transient and self-limited and did not result in patient discontinuation from a study. The following table summarizes the incidence rates of adverse events reported by at least 1% of patients who received Dihydroergotamine Mesylate Nasal Spray for the treatment of migraine headaches during placebo-controlled, double-blind clinical studies and were more frequent than in those patients receiving placebo.

Table 3: Adverse events reported by at least 1% of the Dihydroergotamine Mesylate Nasal Spray treated patients and occurred more frequently than in the placebo-group in the migraine placebo-controlled trials

Other Adverse Events During Clinical Trials
In the paragraphs that follow, the frequencies of less commonly reported adverse clinical events are presented. Because the reports include events observed in open and uncontrolled studies, the role of Dihydroergotamine Mesylate Nasal Spray in their causation cannot be reliably determined. Furthermore, variability associated with adverse event reporting, the terminology used to describe adverse events, etc., limit the value of the quantitative frequency estimates provided. Event frequencies are calculated as the number of patients who used Dihydroergotamine Mesylate Nasal Spray in placebo-controlled trials and reported an event divided by the total number of patients (n=1,796) exposed to Dihydroergotamine Mesylate Nasal Spray. All reported events are included except those already listed in the previous table, those too general to be informative, and those not reasonably associated with the use of the drug. Events are further classified within body system categories and enumerated in order of decreasing frequency using the following definitions: frequent adverse events are defined as those occurring in at least 1/100 patients; infrequent adverse events are those occurring in 1/100 to 1/1,000 patients; and rare adverse events are those occurring in fewer than 1/1,000 patients.

Skin and Appendages: Infrequent: petechia, pruritus, rash, cold clammy skin; Rare: popular rash, urticaria, herpes simplex.

Musculoskeletal: Infrequent: cramps, myalgia, muscular weakness, dystonia; Rare: arthralgia, involuntary muscle contractions, rigidity.

Central and Peripheral Nervous System: Infrequent: confusion, tremor, hypotension, vertigo, Rare: speech disorder, hyperkinesia, stupor, abnormal gait, aggravated migraine.

Autonomic Nervous System: Infrequent: increased sweating.

Special Senses: Infrequent: sense of smell altered, photophobia, conjunctivitis, abnormal lacrimation, abnormal vision, tinnitus, earache; Rare: eye pain.

Psychiatric: Infrequent: nervousness, euphoria, insomnia, concentration impaired; Rare: anxiety, anorexia, depression.

Gastrointestinal: Infrequent: abdominal pain, dyspepsia, dysphagia, hiccup; Rare: increased salivation, esophagospasm.

Cardiovascular: Infrequent: edema, palpitation, tachycardia; Rare: hypotension, peripheral ischemia, angina.

Respiratory System: Infrequent: dyspnea, upper respiratory tract infections; Rare: bronchospasm, bronchitis, pleural pain, epistaxis.

Reproductive, Female: Rare: pelvic inflammation, vaginitis.

Body as a Whole - General: Infrequent: feeling cold, malaise, rigors, fever, periorbital edema; Rare: flu-like symptoms, shock, loss of voice, yawning.

Application Site: Infrequent: local anesthesia.
Post-introduction Reports
Voluntary reports of adverse events temporally associated with dihydroergotamine products used in the management of migraine that have been received since the introduction of the injectable formulation are included in this section save for those already listed above. Because of their source (open and uncontrolled clinical use), whether or not events reported in association with the use of dihydroergotamine are causally related to it cannot be determined.

There have been reports of pleural and retroperitoneal fibrosis in patients following prolonged daily use of injectable dihydroergotamine mesylate. Dihydroergotamine Mesylate Nasal Spray is not recommended for prolonged daily use. (See DOSAGE AND ADMINISTRATION)

To report SUSPECTED ADVERSE REACTIONS, contact Oceanside Pharmaceuticals at 1-800-321-4576 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DRUG ABUSE AND DEPENDENCE
Currently available data have not demonstrated drug abuse or psychological dependence with dihydroergotamine. However, cases of drug abuse and psychological dependence in patients on other forms of ergot therapy have been reported. Thus, due to the chronicity of vascular headaches, it is imperative that patients be advised not to exceed recommended dosages.

OVERDOSAGE
To date, there have been no reports of acute overdose with this drug. Due to the risk of vascular spasm, exceeding the recommended dosages of Dihydroergotamine Mesylate Nasal Spray is to be avoided.

Excessive doses of dihydroergotamine may result in peripheral signs and symptoms of ergotism. Treatment includes discontinuance of the drug, local application of warmth to the affected area, the administration of vasodilators, and nursing care to prevent tissue damage.

In general, the symptoms of an acute Dihydroergotamine Mesylate Nasal Spray overdose are similar to those of an ergotamine overdose, although there is less pronounced nausea and vomiting with Dihydroergotamine Mesylate Nasal Spray. The symptoms of an ergotamine overdose include the following: numbness, tingling, pain, and cyanosis of the extremities associated with diminished or absent peripheral pulses; respiratory depression; an increase and/or decrease in blood pressure, usually in that order; confusion, delirium, convulsions, and coma; and/or some degree of nausea, vomiting, and abdominal pain.

In laboratory animals, significant lethality occurs when dihydroergotamine is given at I.V. doses of 44 mg/kg in mice, 130 mg/kg in rats, and 37 mg/kg in rabbits.

Up-to-date information about the treatment of overdosage can often be obtained from a certified Regional Poison Control Center. Telephone numbers of certified Poison Control Centers are listed in the Physicians’ Desk Reference (PDR)."

DOSAGE AND ADMINISTRATION
The solution used in Dihydroergotamine Mesylate Nasal Spray (4 mg/mL) is intended for intranasal use and must not be injected.

In clinical trials, Dihydroergotamine Mesylate Nasal Spray has been effective for the acute treatment of migraine headaches with or without aura. One spray (0.5 mg) of Dihydroergotamine Mesylate Nasal Spray should be administered in each nostril. Fifteen minutes later, an additional one spray (0.5 mg) of Dihydroergotamine Mesylate Nasal Spray should be administered in each nostril, for a total dosage of four sprays (2 mg) of Dihydroergotamine Mesylate Nasal Spray. Studies have shown no additional benefit from acute doses greater than 2 mg for a single migraine administration. The safety of doses greater than 3 mg in a 24 hour period and 4 mg in a 7 day period has not been established.

Dihydroergotamine Mesylate Nasal Spray should not be used for chronic daily administration.

Prior to administration, the pump must be primed (i.e., squeeze 4 times) before use. (See administration instructions).

Once the nasal spray applicator has been prepared, it should be discarded (with any remaining drug in opened vial) after 8 hours.

HOW SUPPLIED

Patient Information

Information for the Patient
Dihydroergotamine Mesylate Nasal Spray.

The solution used in Dihydroergotamine Mesylate Nasal Spray (4 mg/mL) is intended for intranasal use and must not be injected.

Please read this information carefully before using your Dihydroergotamine Mesylate Nasal Spray for the first time. Keep this information handy for future reference. This leaflet does not contain all of the information on Dihydroergotamine Mesylate Nasal Spray. Your pharmacist and/or health care provider can provide more detailed information.

Dihydroergotamine Mesylate Nasal Spray has been evaluated in a limited number of patients long term (e.g., 1 year or longer).

Purpose of your Medication
Dihydroergotamine Mesylate Nasal Spray is intended to treat an active migraine headache. Do not try to use it to prevent a headache if you have no symptoms. Do not use it to treat common tension headache or a headache that is not at all typical of your usual migraine headache. Administration of Dihydroergotamine Mesylate Nasal Spray, should not exceed the dosing guidelines and should not be used for chronic daily administration. There have been reports of fibrosis (stiffening) in the lung or kidney areas in patients following prolonged daily use of injectable dihydroergotamine mesylate. Rarely, prolonged daily use of other ergot alkaloid drugs (the class of drugs to which Dihydroergotamine Mesylate Nasal Spray belongs) has been associated with heart valvular fibrosis. Rare cases have also been reported in association with the use of injectable dihydroergotamine mesylate; however, in those cases, patients also received drugs known to be associated with heart valvular fibrosis.

Do not use dihydroergotamine mesylate nasal spray if you:
• Are pregnant or nursing.
• have any disease affecting your heart, arteries, or circulation.
• are taking certain anti-HIV medications (protease inhibitors)
• are taking a macrolide antibiotic such as troleandomycin, clarithromycin or erythromycin.

Important questions to consider before using Dihydroergotamine Mesylate Nasal Spray
Please answer the following questions before you use your Dihydroergotamine Mesylate Nasal Spray. If you answer YES to any of these questions or are unsure of the answer, you should talk to your doctor before using Dihydroergotamine Mesylate Nasal Spray.
• Do you have high blood pressure?
• Do you have chest pain, shortness of breath, heart disease, or have you had any surgery on your heart arteries?
• Do you have risk factors for heart disease (such as high blood pressure, high cholesterol, obesity, diabetes, smoking, strong family history of heart disease, or are you postmenopausal or a male over 40)?
• Do you have any problems with blood circulation in your arms or legs, fingers, or toes?
• Are you pregnant? Do you think you might be pregnant? Are you trying to become pregnant? Are you sexually active and not using birth control? Are you breast feeding?
• Have you ever had to stop taking this or any other medication because of an allergy or bad reaction?
• Are you taking any other migraine medications, erythromycin or other antibiotics, or medications for blood pressure prescribed by your doctor, or other medicines obtained from your drugstore without a doctor’s prescription?
• Do you smoke?
• Have you had, or do you have, any disease of the liver or kidney?
• Is this headache different from your usual migraine attacks?
Assemble your nasal sprayer only when you are ready to use it.

3. Assemble the sprayer:
   - Lift tab to bend back blue cover. In one piece, completely remove the blue cover and metal seal in a circular motion. Keeping the vial upright, remove rubber stopper. Set vial aside.

2. Check the contents of the package:
   - 8 Nasal Spray Vials
   - 8 Nasal Sprayers
   - Administration Instructions
   - Package Insert

3. Assemble your sprayer:
   - Remove plastic cover from the bottom of pump unit. Insert spray pump into vial and turn clockwise until securely fastened.

4. Using the sprayer:
   - Remove cap from sprayer unit. Holding the vial upright, point nasal sprayer away from face and pump 4 times before using. DO NOT PUMP MORE THAN 4 TIMES. (Although some medication will spray out, there is enough medication in each vial to allow you to prepare your nasal spray pump properly and still receive a full treatment of dihydroergotamine mesylate.)
   - Spray once into each nostril. Do not tilt head back or sniff through your nose while spraying or immediately after. Wait 15 minutes. Spray once again into each nostril.

5. After completing these instructions:
   - Carefully dispose of the nasal spray pump with the vial.

Important Notes:
- Once a Dihydroergotamine Mesylate Nasal Spray vial has been opened, it must be thrown away after 8 hours.

Storing Dihydroergotamine Mesylate Nasal Spray
- Keep medication in a safe place away from children
- Keep Dihydroergotamine Mesylate Nasal Spray away from heat and light.
- Do not expose Dihydroergotamine Mesylate Nasal Spray to temperatures over 77°F.
- Never refrigerate or freeze Dihydroergotamine Mesylate Nasal Spray.
- Do not keep an opened Dihydroergotamine Mesylate Nasal Spray vial for more than 8 hours.

Check the expiration date printed on the vial containing medication. If the expiration date has passed, do not use it.

Answers to patients' questions about Dihydroergotamine Mesylate Nasal Spray

What if I need help in using my Dihydroergotamine Mesylate Nasal Spray?
If you have any questions or if you need help in opening, putting together, or using Dihydroergotamine Mesylate Nasal Spray, speak to your doctor or pharmacist, or contact Oceanside Pharmaceuticals at 1-800-321-4576.

How much medication should I use and how often?
Each vial contains one complete dose of Dihydroergotamine Mesylate Nasal Spray, which is spray in each nostril followed in 15 minutes by an additional spray in each nostril, for a total of 4 sprays.

Studies have shown no benefit from acute doses greater than 2 mg (4 sprays) for a single administration. The safety of doses greater than 3 mg in a 24 hour period has not been established.

The safety of doses greater than 4 mg in a 7-day period has not been established.

Dihydroergotamine Mesylate Nasal Spray, should not be used for chronic daily administration.

Learn what to do in case of an Overdose
If you have used more medication than you have been instructed, contact your doctor, hospital emergency department, or nearest poison control center immediately.

How to use the Dihydroergotamine Mesylate Nasal Spray
1. Use available training materials.
   - Read and follow the instructions in the administration instructions which are provided with the Dihydroergotamine Mesylate Nasal Spray package before attempting to use the product.
   - If there are any questions concerning the use of your Dihydroergotamine Mesylate Nasal Spray, ask your doctor or pharmacist, or contact Oceanside Pharmaceuticals at 1-800-321-4576.

2. Check the contents of the package:
   - 8 Nasal Spray Vials
   - 8 Nasal Sprayers
   - Administration Instructions
   - Package Insert

3. Assemble your sprayer:
   - Assemble your nasal sprayer only when you are ready to use it.
   - Lift tab to bend back blue cover. In one piece, completely remove the blue cover and metal seal in a circular motion. Keeping the vial upright, remove rubber stopper. Set vial aside.

- Are you using dihydroergotamine mesylate nasal spray or other dihydroergotamine mesylate containing drugs on a daily basis?
- Are you taking a protease inhibitor for HIV therapy?
- Are you taking a macrolide class of antibiotic?

Serious or potentially life-threatening reductions in blood flow to the brain or extremities have been reported rarely due to interactions between Dihydroergotamine Mesylate Nasal Spray and protease inhibitors or macrolide antibiotics.

REMEMBER TO TELL YOUR DOCTOR IF YOU HAVE ANSWERED YES TO ANY OF THESE QUESTIONS BEFORE YOU USE Dihydroergotamine Mesylate Nasal Spray.

Side Effects To Watch Out For
In clinical trials, most migraine patients have used Dihydroergotamine Mesylate Nasal Spray without serious side effects. You may experience some nasal congestion or irritation, altered sense of taste, sore throat, nausea, vomiting, dizziness, and fatigue after using Dihydroergotamine Mesylate Nasal Spray.

These side effects are temporary and usually do not require you to stop using Dihydroergotamine Mesylate Nasal Spray. Although the following reactions rarely occur, they can be serious and should be reported to your physician immediately:
- Numbness or tingling in your fingers and toes
- Pain, tightness, or discomfort in your chest
- Muscle pain or cramps in your arms and legs
- Weakness in your legs
- Temporary speeding or slowing of your heart rate
- Swelling or itching

Dosing Information
- Each vial contains one complete dose of Dihydroergotamine Mesylate Nasal Spray, which is 1 spray in each nostril followed in 15 minutes by an additional spray in each nostril, for a total of 4 sprays.

- Studies have shown no benefit from acute doses greater than 2 mg (4 sprays) for a single administration. The safety of doses greater than 3 mg in a 24 hour period has not been established.

- The safety of doses greater than 4 mg in a 7-day period has not been established.

- Dihydroergotamine Mesylate Nasal Spray, should not be used for chronic daily administration.

How much medication should I use and how often?
Each vial contains one complete dose of Dihydroergotamine Mesylate Nasal Spray, which is 1 spray in each nostril followed by an additional spray in each nostril 15 minutes later for a total of 4 sprays. Do not use more than this amount unless instructed to do so by your doctor.

Dihydroergotamine Mesylate Nasal Spray is not intended for chronic daily use.

Why do I have to prime or pump the Nasal Sprayer 4 times before using? Am I wasting the medication?
You have to prime the Nasal Sprayer 4 times to make sure that you get the proper amount of medication when you use it. Although you will see some medication spray out, there is still enough medication in each vial to allow you to prepare your sprayer properly and still receive a full dose of Dihydroergotamine Mesylate Nasal Spray.

Can I assemble the medication vial and the Nasal Sprayer so it is ready before I need to use it?
No. The brown (amber) glass vial containing your medication must remain unopened until you are ready to use it. It may not be fully effective if opened and not used within 8 hours.

Can I reuse my dihydroergotamine mesylate nasal sprayer?
No. After completing the full dose, you must carefully dispose of your Dihydroergotamine Mesylate Nasal Spray and the opened vial. You should use a new unit for your next migraine attack. Each Unit contains a new Nasal Sprayer, and a vial of Dihydroergotamine Mesylate Nasal Spray medication.
Can I use dihydroergotamine mesylate nasal spray if I have a stuffy nose, cold, or allergies?
Yes. Dihydroergotamine Mesylate Nasal Spray can be used if you have a stuffy nose, cold, or allergies. However, if you are taking any medications for your cold, or allergies, even those you can buy without a doctor's prescription, speak with your doctor before using Dihydroergotamine Mesylate Nasal Spray.

Do I need to sniff the medication when I spray it in my nostril?
No, you should not sniff because Dihydroergotamine Mesylate Nasal Spray should remain in the nose so that it can be absorbed into the bloodstream through the lining of the nose.

If you have any other unanswered questions about Dihydroergotamine Mesylate Nasal Spray, consult your doctor or pharmacist.

Administration Instructions: How to Use
DIHYDROERGOTAMINE MESYLATE NASAL SPRAY

**NOTE:** Do not assemble the nasal spray pump unit until the time of use. Once it has been opened, it must be discarded after 8 hours.

1. Lift tab to bend back blue cover (Figure 1). In one piece, completely remove the blue cover and metal seal in a circular motion (Figure 2). Keeping the vial upright, remove rubber stopper (Figure 3). Set vial aside.
2. Remove plastic cover from bottom of pump unit (Figure 4). Insert spray pump into vial and turn clockwise until securely fastened (Figure 5).
3. Remove cap from spray unit (Figure 6). Holding the vial as shown in Figure 7, point nasal sprayer away from face and pump 4 times before using (Figure 7). **DO NOT PUMP MORE THAN 4 TIMES.** (Although some medication will spray out, there is enough medication in each vial to allow you to prepare your nasal spray pump properly and still receive a full treatment of Dihydroergotamine Mesylate.)
4. Spray once into each nostril. **Do not tilt head back or sniff through your nose while spraying or immediately after.** Wait 15 minutes. Spray once again into each nostril. After completing these instructions, carefully dispose of the nasal spray pump with vial.
